Project Name	Library Book Request Management System in ServiceNow
Maximum Marks	5 Marks

Project Planning

The **Library Book Request Management System in ServiceNow** project was planned to simplify and automate the process of managing library book requests submitted by students. The planning phase involved identifying the requirements of students and librarians, designing a user-friendly **Service Catalog**, creating **Catalog Variables** to capture book request details, developing a **Custom Table** to store request records, implementing a **Business Rule** to validate that the Issue Date is not in the past, configuring **Number Maintenance** to generate a unique Request Number automatically, and creating a **Flow Designer** workflow to send email notifications to the librarian. The project was thoroughly tested to ensure accurate data validation, successful email delivery, automatic request number generation, and efficient request tracking before deployment.

Project Logic

The **Library Book Request Management System** follows a simple and automated workflow. A **student** submits a library book request through the **ServiceNow Service Catalog** by entering the required details such as **Student Name, Book Name, Author Name, Issue Date, Return Date, Status, and Librarian Email**. The system validates the entered information using a **Business Rule** to ensure that the Issue Date is not a past date. After successful validation, **Number Maintenance** automatically generates a unique **Request Number**, and the request details are stored in the **Library Book Request** custom table. **Flow Designer** is then triggered to automatically send an email notification to the librarian with the submitted request details. The librarian reviews the request and updates its status as **Requested, Approved, Rejected, Issued, or Returned**. Throughout the process, all request information is maintained in the database, allowing efficient tracking, better record management, and transparent communication between students and the librarian.

PROJECT PLANNING

The Library Book Request Management System project was planned in a structured manner to automate the library book request process in ServiceNow. The planning includes requirement analysis, design, development, testing and deployment.

PROJECT LOGIC (WORKFLOW)

The system follows an automated workflow from book request submission to completion with notifications and status updates.
